

Claims

1. A device (1) for inserting implants (10) in the
5 form of cylinders of small diameter, comprising
gripping means (2), a trocar (3) fixed at its
proximal end (4) to the gripping means (2), and a
push rod (5) mounted so as to slide through the
trocar (3) and the gripping means (2),
10 characterized in that the gripping means (2)
include a rotary element (6) defining an axis of
rotation (7) parallel to the trocar axis (8) and
comprising a plurality of tubular elements (9)
arranged around said axis of rotation (7) and
15 mounted so as to be able to be aligned
successively with the trocar (3), said rotary
element (6) forming an integral part of the
gripping means (2) and extending along most of the
length of said gripping means, each tubular
20 element (9) being designed to contain at least one
implant.
2. The device as claimed in claim 1, characterized in
that each tubular element (9) forms a part
25 distinct from the rest of the rotary element (6).
3. The device as claimed in claim 2, characterized in
that each tubular element (9) can be inserted into
the rotary element (6).
30
4. The device as claimed in claim 2 or 3,
characterized in that it comprises means (12, 13)
which prevent withdrawal of the tubular elements
(9) from the rotary element (6).
35
5. The device as claimed in any one of the preceding
claims, characterized in that it comprises means

for viewing the passage of the implants which are located in the tubular element (9) aligned with the trocar (3).

- 5 6. The device as claimed in the preceding claim, characterized in that the means for viewing the passage of the implants comprise a window (14).
7. The device as claimed in any one of the preceding
10 claims, characterized in that the gripping means (2) have a flattened section (15).
8. The device as claimed in any one of the preceding
15 claims, characterized in that the rotary element (6) comprises a knurled wheel (16).
9. The device as claimed in any one of the preceding
20 claims, characterized in that each tubular element (9) includes means (11) for retaining the implants (10) when the device (1) is at rest.
10. The device as claimed in the preceding claim, characterized in that the means for retaining the
25 implants are composed of a flexible tongue (11) arranged inside the tubular elements (9).
11. The device as claimed in any one of the preceding
30 claims, characterized in that it comprises means which retain the rotary element (6) and prevent withdrawal of the rotary element (6) once the latter has been placed in the gripping means (2).
